

# Cuyahoga River Old Channel (CROC) Sediment Project REMEDIAL FOOTPRINT

## BACKGROUND

The sediment in the CROC contains polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), oil and grease, and metals, which can be toxic to benthic organisms.

## PURPOSE

The goal of the project is to improve the aquatic environment by mechanically dredging (removing) ~100,000 cubic yards of contaminated sediment from the CROC.

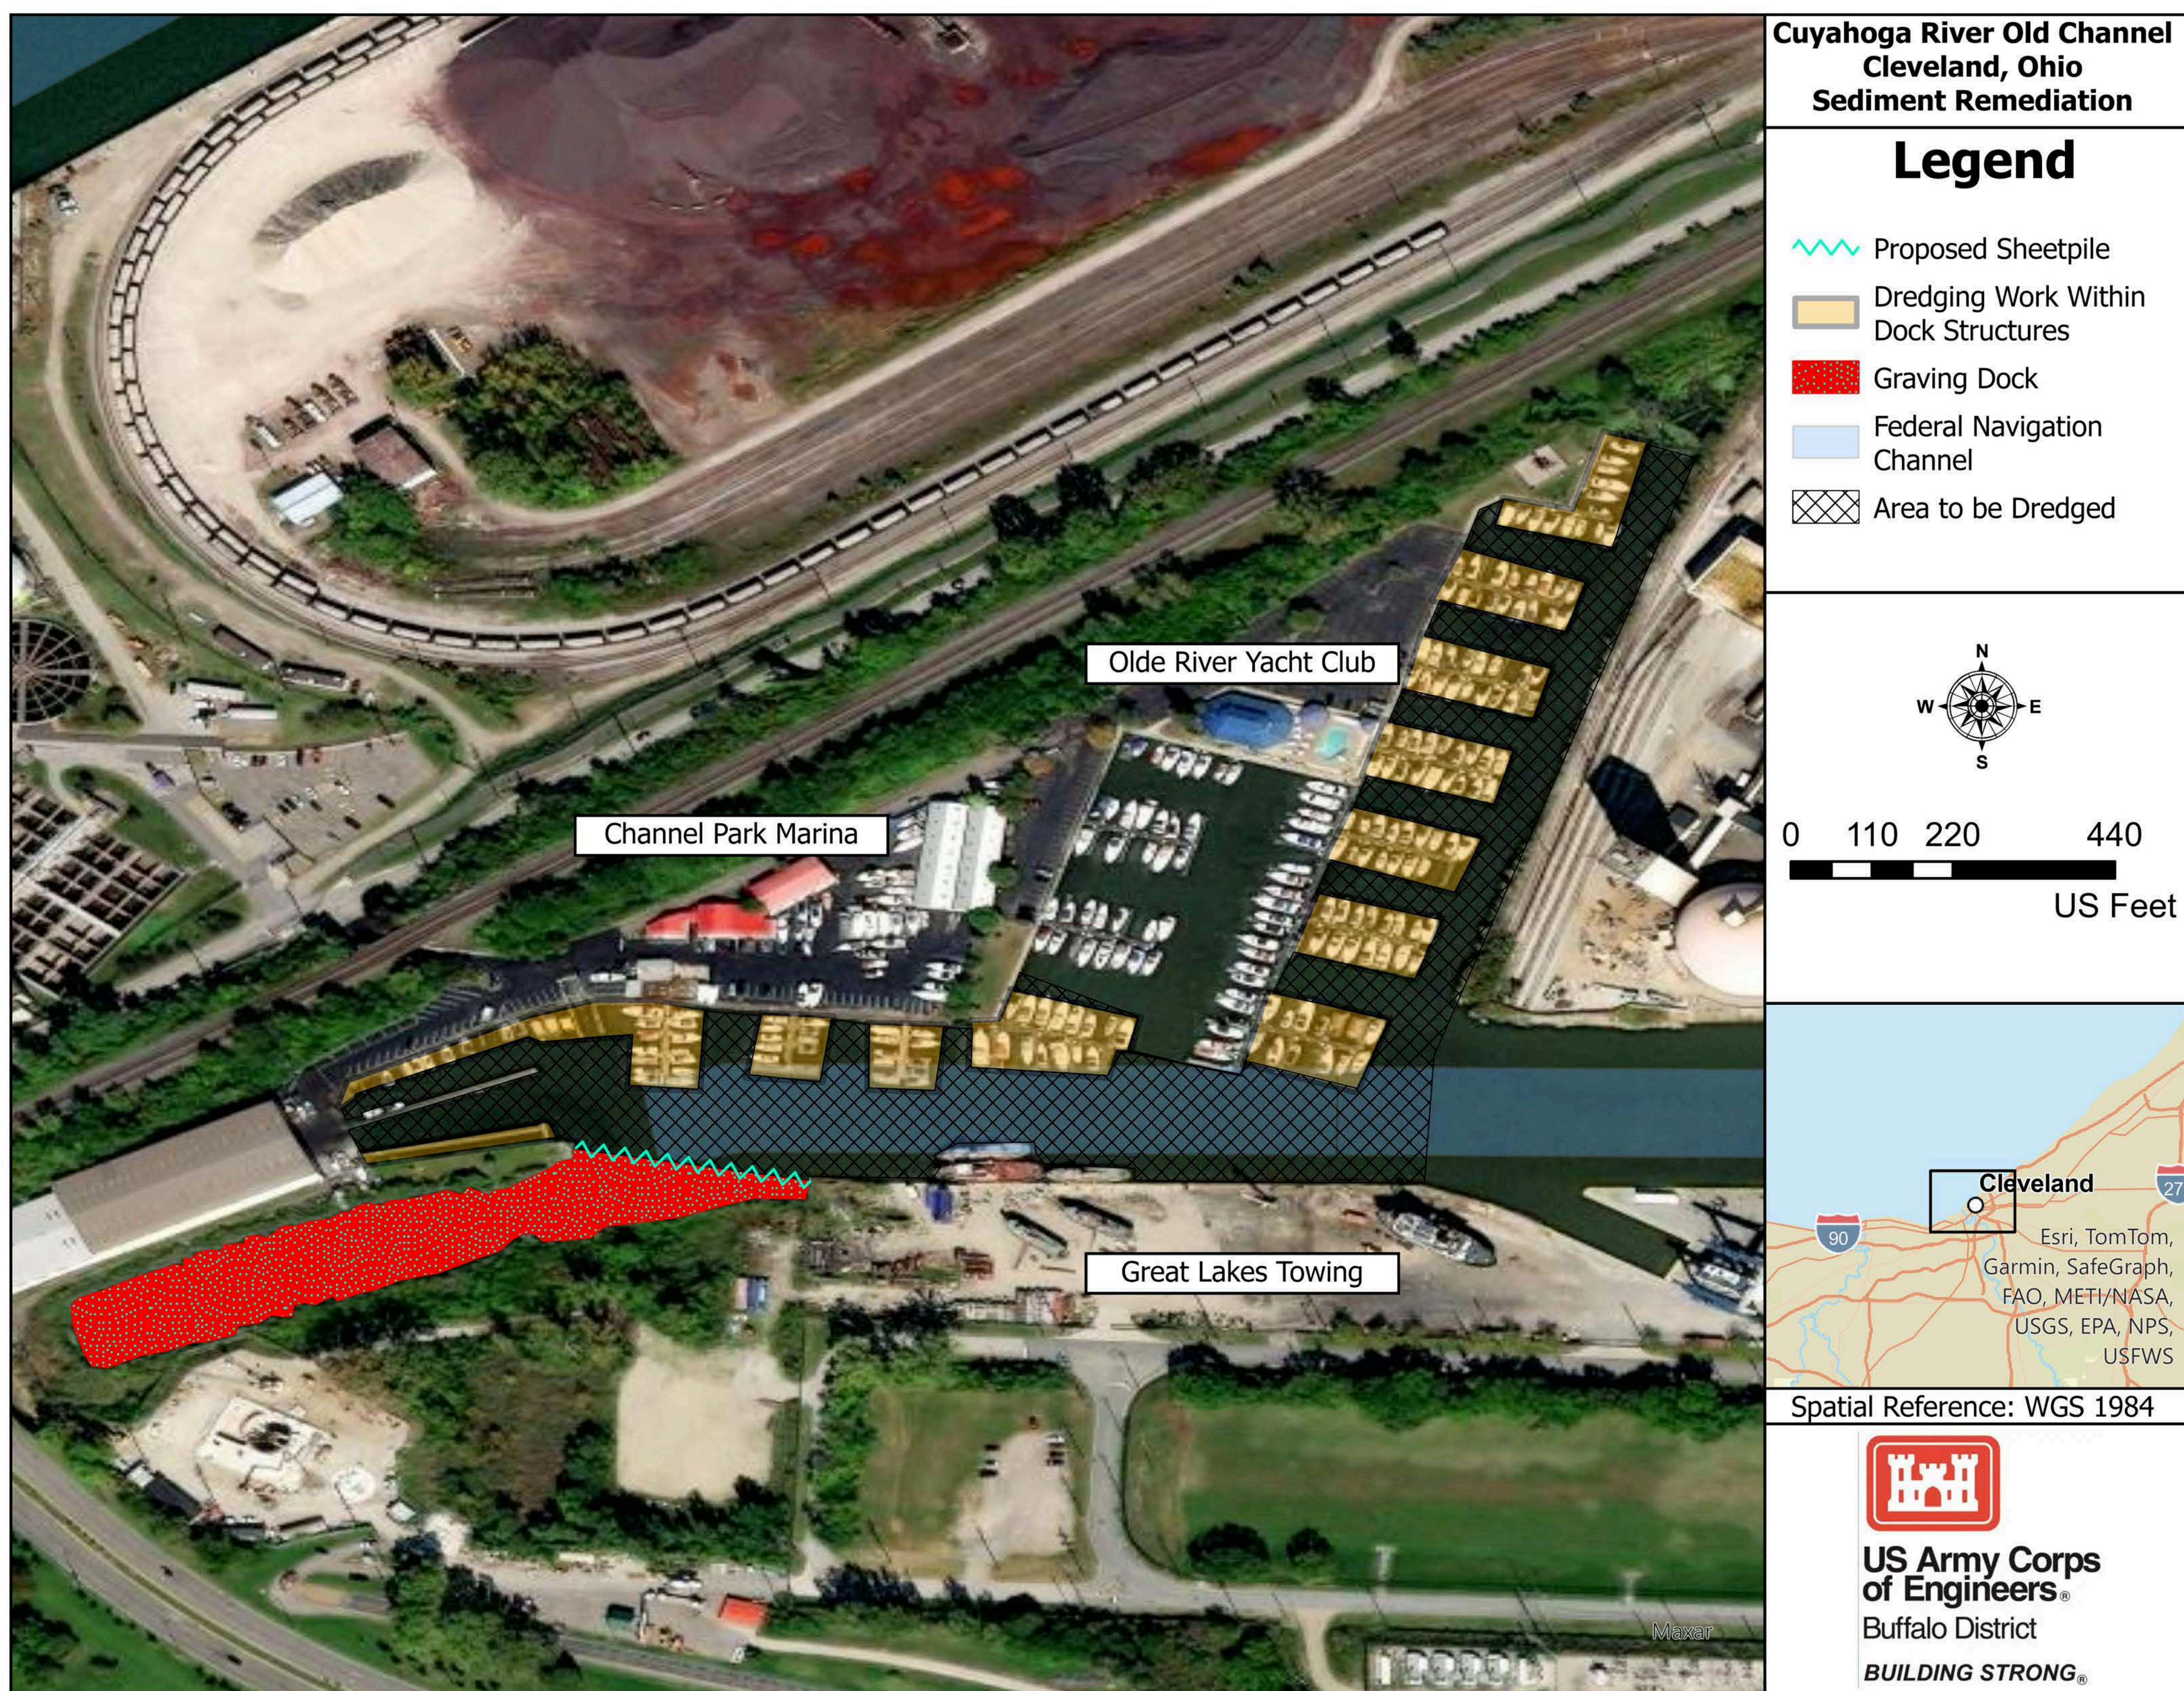

Figure 1 is a map that shows the areas where contaminated sediment will be remediated.

Figure 2 shows a view of the Cuyahoga River Old Channel.

Figure 3 shows a view of the Cuyahoga River Old Channel.
